

**Figure 12.** Distribution of land-cover-derived carbon density in the KFR in 1989 (*upper panel*) and 2001 (*lower panel*).

It is also interesting to note that there were a few plots with much higher carbon densities than the average (Appendix 3), as shown in Table 24. From a statistical point of view, these are outliers that affect the average values. These plots were not used in the extrapolation. We suggest they should be validated on the ground.
